

Idea 1

Multiplication Game

This game concept is inspired by the challenges of learning multiplication tables in elementary school. The game aims to transform this chore into a fun and educational experience for all ages.

Game Mechanics

- **User Authentication and Data Storage:** Users can log in to track their progress and save scores to a database.
- **Quick-Fire Questions:** The core gameplay involves rapid-fire multiplication problems.
- **Immediate Feedback:** The game provides instant feedback on answers, indicating whether they are correct or incorrect, and then presents the next problem.
- **Timed Sessions and Scoring:** After a set time (e.g., 45 seconds), the game ends, displays the final score, and saves it to the database.
- **Game Restart** - the user could click a button to start a new game.
- **High Score Tracking:** The game keeps track of the user's high score, which can be reset.

Target Audience and Educational Value

The game is designed to be enjoyable for all ages while helping players practice and improve their multiplication skills. It offers a gamified approach to learning and reinforcing multiplication tables, making it a valuable tool for students and anyone looking to brush up on their math facts.

Idea 2

A Port Of San Diego dashboard website.

This would be an interface for ships (large commercial ships, and Cruise Ships) in the Port of San Diego.

It would have an interactive map of the ports in the Bay, and clicking on a Port would display which ships are docked there, and their schedule.

There would also be an AIS (ship tracking) map of the Bay, so one could see ships in transit - and also the ships that are docked in the ports.

The website would display the ship schedule for the Bay and all its Ports for the current month.

The website would also display the current weather conditions, and upcoming weather forecast.

The website would also show the weather history for any calendar day in the Bay.

Idea 3

A rebuild of my Capstone 1 - Event Weather App

Capstone 1 was built in Python, and before I had the knowledge I do now.

I would like to start over on the App, and build a new and improved version using JS and React.

It would have a database, and store & display information on User's previous searches.

The website uses API calls to get the weather history for a user entered location for a particular day for the past 3 - 10 years.
